

*Smart Power Systems[®] and XRT[®] Power Systems team up to introduce
The...liberator[™]*

REED CITY, MI - Smart Power Systems[®], the leading manufacturer of hydraulic generators and XRT[®] Power Systems, the leading manufacturer of rescue tool power systems for fire, rescue and industrial applications today jointly announce the availability of **The...liberator[™]** hydraulic generator plus rescue tool pump system, which provides emergency response professionals with the power they need to run the tools they prefer.

The...liberator[™]

The...liberator[™] was designed for applications that need PTO power at fixed or variable engine RPM, enabling the truck to make electrical power while driving to the scene or during pumping operations. The entire system is powered by one hydraulic pump, which is also available with an optional through-drive allowing mounting of another hydraulic pump off the same PTO port. The rescue tool pump will be attached directly to the Smart Power generator shaft and frees up critical space next to the transmission PTO and in compartments.

Unlike competitive systems that restrict operators by requiring them to use tools from one specific manufacturer, the patented **...liberator[™]** ensures connectivity with rescue tools from all tool manufacturers, allowing response personnel the freedom to choose the best tools to meet their needs. **The...liberator[™]** is capable of powering up to three hydraulic cutting, spreading and extrication tools, while simultaneously powering lighting, cord reel tools and other electrical accessories up to the full-rated generator output. Designed for installation on new vehicles, as well as trouble-free retrofitting of vehicles already in use, **The...liberator[™]** is easy to set up and operate, and delivers the extremely fast response times that can literally make the difference between a safe rescue and a preventable tragedy!

The...liberator™ is based on a Smart Power 1800 RPM (15kW or 10kW) hydraulic generator which is designed for quiet, cool, continuous duty running in even the worst conditions. The integrated XRT device delivers up to 10,500 PSI and is designed to power rescue tools at distances up to 100 feet from **The...liberator™** base unit. Specifications include a patented dual stage continuous duty pump, stainless steel high pressure fittings and a three gallon filtered reservoir.

The...liberator™ provides emergency response professionals with the power they need to run the tools they prefer.

“With the ever increasing demands on fire apparatus, we developed **The...liberator™** to provide a space-saving, highly efficient solution to run a generator capable of making full power at any engine speed, and a powerful rescue tool power system capable of running the rescue tools that you already have, powered entirely off one transmission PTO port”, said Will Leach, Vice President of Sales and Service for Smart Power Systems. Robert Hansen, President of XRT Power Systems added “Our innovative, patented design is the most versatile system on the market, consistently delivering the shortest time between arrival and extrication.”

Smart Power generators provide the XRT pump a solid platform along with reliable power via its heavy-duty hydraulic system. “With our patented advanced electronic control system, **The...liberator™** will continue to offer the same high reliability generator systems, with fully automated protection, on-board diagnostics, and precisely regulated power output” said Leach.

The...liberator™ system is competitively priced for OE builders and dealers and is now available throughout the U.S. and Canada. For more information, contact your regional Smart Power sales manager, or contact our main office at 231-832-5513 (www.smartpower.com). XRT Power Systems can be reached at 800-343-0480 (www.xrtcombi.com).
